

Georgetown Homeowner Seasonal Maintenance Checklist

Georgetown Home Services · georgetownhomeservices.com

Spring (Mar–May)

- Test AC before the first 90°+ week: run a cooling cycle and note odd sounds, weak airflow, or warm supply air.
- Clear debris from outdoor HVAC unit; keep 2–3 feet of clearance on sides and top.
- Walk the roofline from the ground after storms: lifted shingles, damaged flashing, gutter overflow.
- Exercise main water shutoff valve gently; confirm everyone in the home knows where it is.
- Check irrigation heads and drip lines for leaks after freeze risk has passed.

Summer (Jun–Aug)

- Replace or wash HVAC filter on schedule (often monthly in heavy cooling season).
- Monitor indoor humidity; sticky air can signal drainage or coil issues.
- Watch for slab moisture or musty odors after heavy rain—note changes for a plumber or foundation pro.
- Trim vegetation away from siding and roof; keep gutters flowing during summer downpours.

Fall (Sep–Nov)

- Schedule heating check before first sustained cool spell if you use gas heat or heat pump heating.
- Clean gutters and downspouts after leaves drop; verify downspouts discharge away from the foundation.
- Inspect attic for daylight, stained decking, or damp insulation after rain.
- Drain and winterize hose bibs if exposed to hard freezes; insulate outdoor pipes where needed.

Winter (Dec–Feb)

- On freeze nights, drip faucets and open cabinet doors on exterior walls if pipes are vulnerable.
- Reverse ceiling fans where appropriate to keep warm air circulating.
- After ice or wind events, scan the roof and fence from the ground for new damage.
- Test smoke/CO detectors; replace batteries or units per manufacturer guidance.
