

Georgetown Spring Home Checklist (March–May)

Georgetown Home Services · georgetownhomeservices.com

Spring (March–May) — this season

- HVAC: Run a cooling cycle before the first heat wave; note weak airflow, odd smells, or warm supply air.
- HVAC: Replace or wash the filter; cedar pollen clogs filters faster than many owners expect.
- HVAC: Clear leaves and pollen from the outdoor condenser—keep 2–3 feet of side clearance.
- Roofing: Walk the roofline from the ground after storms; look for lifted shingles, dented vents, and gutter overflow.
- Roofing: Check downspouts for granule grit after rain—a sign of shingle wear or recent hail bruising.
- Roofing: Photograph soft metals (mailbox, gutter strip) if hail passes Williamson County.
- Plumbing: Exercise the main water shutoff gently; label it if guests or renters are in the home.
- Plumbing: Inspect hose bibs and irrigation lines after the last freeze risk—slow leaks often show up first on the bill.
- Plumbing: Flush rarely used guest baths in Sun City to keep traps full.
- Landscaping: Tune irrigation for spring rains—overwatering on clay soil stresses foundations.
- Landscaping: Trim branches away from the roof and siding before summer storms.

Prep for Georgetown summer (June–August)

- Book an AC tune-up if cooling struggled last July—calendars fill before triple-digit weeks.
- Stock spare filters and know your filter size before peak season.
- Confirm attic insulation and door seals; hot upstairs rooms are often airflow, not just equipment age.
- Budget for repairs vs replacement using our HVAC repair cost guide before peak summer pricing.
